

Iron Sentinel: Splunk Detection Dashboard

Logan Dubyak
28 June 2026

1. Overview

The Iron Sentinel Detection Dashboard brings together the project's three detection rules and overall log health into a single at-a-glance view. It was built as a Splunk Classic Dashboard with four panels, each tied to a specific MITRE ATT&CK technique or general monitoring need.

A full-dashboard screenshot is included alongside this document. Below is a reference for each panel with what it shows, how it's visualized, and the exact SPL search behind it.

2. Panel Reference

#	Panel	Visualization	Search
1	Failed logins over time	Column Chart	index=main EventCode=4625 timechart span=1h count by Account_Name
2	PowerShell Obfuscation Events	Column Chart	index=main sourcetype="XmlWinEventLog:Sysmon" "<EventID>1</EventID>" "powershell.exe" "-enc" timechart span=1h count
3	Logon Activity by Hour	Bar Graph	index=main source="WinEventLog:Security" EventCode=4624 stats count by date_hour sort date_hour
4	Log Sources Overview	Pie Chart	index=main stats count by sourcetype

The three detection rules already exist as scheduled Splunk alerts, but a dashboard adds something an alert can not do. It provides a continuous and visual sense of what is happening across the

environment and not just a notification when a threshold is crossed. In a production SOC, an analyst would use this dashboard during a shift to watch for trends and anomalies. Then the alerts would handle the automated after-hours notifications.
